                                                                                                              This invention relates to a trypsin modulating oostatic factor (TMOF) compound. The compound specifically does not include the TMOF analogue peptides represented by AAB37942 - AAB37949. Sequences AAB37900 - AAB37941 are TMOF analogues which may be included in the composition. The TMOF compound has pesticidal activity and is an inhibitor of pest digestive enzyme synthesis. The TMOF compound is useful for controlling the second controlling and the second controlling that the controlling that the controlling that the second controlling the second controlling that the second controlling that the second controlling that the second controlling the second controlling that the second controlling the second controlling that the s
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The inventors claim a method for the prodn. of aspartame by first synthesising double-stranded DNA in which a coding strand has alternating codins for Asp and the Phe in sufficient number to produce a polypeptide which is stable in predetermined host microorganisms. The DNA strand is then inserted into a cloning vehicle so that the resulting chimera directs the synthesis of the Asp-Phe protein. This protein is then cleaved with CNBr or trypsin to release the peptide which, after benzylation, can be fragmented by digestion with chymotrypsin.

                                                                              The inventors claim hhpGRF fragments used for the synthesis of hpGRF using the method somatocrinin can be obtd. on a large scale with good yield and good purity. The prod. is used in man for the treatment of dwarfism and retarded growth and for anabolic protein deficiencies. In animals it is useful for promoting wt. growth for increased prodn., lactation etc. This index is based on EP-122818,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Peptide core is repeated 2-20 times to form a cell-adhesive protein of mol. wt. 1,500-5,000. The protein is an (ant)agonist of cell-adhesive proteins such as fibronectin. It has high antimetastatic activity against cancer and can be used in immunomodulation, wound healing, platelet aggregation inhibition and alleviation of neuro-disorders. See also AAR00722.
                  peptide are also provided, comprising C-terminal truncations, N-terminal truncations, or modifications of specific amino acids, e.g. the most potent Ras inhibitor is accounted acronoma, exocrine pancreatic carcinoma and myeloid leukaemias. Ras complexed with GTP can bind GAP and this is thought to be the important step in the
                                                                                                                              The peptide corresponds to a C- and N-terminal truncated version the prod. of the Harvey ras oncogene from residues 17-44, i.e. fi residues 30-32. The peptide is capable of binding to GTPase
                                                                                                                                                                                                               Synthetic peptide inhibitors of Ras-GAP interaction antitumour agents against e.g. colorectal carcinoma pancreatic carcinoma and myeloid leukaemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polypeptide with repeated as anti-metastatic agent f cell-adhesion proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GTPase; activating protein; GAP; oncogenesis; cancer; truncated;

                                                                                                                                        The sequence is that of an RGD-conty peptide which is used in a method for prevention of adhesion formation for a time sufficient to permit tissue repair. The method is used for minimising or preventing adhesion formation, partic. in the peritoneum following surgery, but also for e.g. cardiovascular, orthopedic, thoracic, ophthalmic, CNS and other uses. In addn. The peptide inhibits platelet aggregation and does not induce inflammation or trauma

                                                                                                                                                                                                                                                                                                                                                                                                                                         C-terminal peptide fragment of the truncated GAG protein. The DNA encoding this fragment was ligated into Clar/Sall digested pX and the corresponding plasmid was used to produce the antisense virus of the invention. Antisense or truncated RNAs expressed by these viruses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New antisense viruses and anti:sense-ribozyme viruses - treating or preventing viral infections, partic. HIV-1, SIV infection

                                                                                                                                       AAR82907;
                                                                                                                                                              AAR82907 standard; peptide; 3
                                                                                                                                                                                                                                                                                                                                                    preventing the NOV from replicating. The antisense viruses maintain the infectivity of the NOVs, allowing antisense RNAs to reach the mRNAs of the natural viruses. Antisense viruses such as these may be used for treating or preventing a viral infection, particularly HIV-1, HIV-2 or SIV infection or hepatitis B infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WPI; 1994-065685/08

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              polysaccharide, preferably a water soluble dextran, at the C-terminus. The peptides are useful in inhibiting cancer metastasis, healing wounds and the regulation of immunogenicity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Disclosure; Page 3; 6pp; Japanese.

The peptides AAR70472-90 and AAR82907-24 are peptide derivatives which inhibit cancer metastasis. They are composed of an adhesive peptide with a core sequence selected from: RGD (AAR70472-85), YIGSR (AAR70486-90) or other sequence (AAR82907-24), linked to a water soluble

a water soluble

The peptides are useful in inhibiting cancer metastasis, healing wounds and the regulation of immunogenicity.
AAR64556-589 are peptide derivatives of a 37 mer RF-1 peptide derived from respiratory syncitial virus (RS) (AAR64590) which have been truncated at the carboxy terminus. The peptides are DP-178 like peptides. DP-178 corresponds to amino acids 638 to 673 of the HIV-1 isolate LAI transmembrane protein gp41. It forms a putative alpha helix at the C-terminal end of the gp41 ectodomain, and complexes with DP-107 (corresponds to amino acids 558-595) which contains a leucine zipper motif. The peptides complex via non-covalent protein interactions. The peptide derivatives were identified by a computer assisted peptide sequence search. The antiviral activity of this peptide is not stated in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          antiviral activity; DP-178; DP-107; diagnostic; HIV-1LAI;

J. Bacteriol. 172:6797-6802(1990).

-I- FUNCTION: ACYL-PROTEIN SYNTHETASE ACTIVATES TETRADECANOIC ACID.

IT IS A COMPONENT OF THE FATTY ACID REDUCTASE COMPLEX RESPONSIBLE FOR CONVERTING TETRADECANOIC ACID TO THE ALDEHYDE WHICH SERVES AS SUBSTRATE IN THE LUCIFERASE-CATALYZED REACTION.

-I- CATALYTIC ACTIVITY: ATP + an acid + protein - AMP + diphosphate + an acyl-protein thiolester.

-I- PATHWAY: Bioluminescent fatty acid reduction system; second step.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SEQUENCE FROM N.A.
